Farm Business Management Reports		EB 1906
	2001 COST OF PRODUCING PROCESSING AND FRESH POTATOES UNDER CENTER PIVOT IRRIGATION COLUMBIA BASIN, WASHINGTON	
	Herbert Hinman Gary Pelter Erik Sorensen	
COOPERATIVE EXTENSION WASHINGTON STATE UNIVERSITY		

Enterprise costs and returns vary from one farm to the next and over time for any particular farm. Variability stems from differences in:

- Capital, labor, land, and management resources
- Type and size of machinery complement
- Cultural practices
- Size of farm and enterprise
- Crop yields
- Input prices
- Commodity prices

Costs can also be calculated differently depending on the intended use of the cost estimate. The information in this publication serves as a general guide for potatoes grown on a modern, well-managed Columbia Basin farm. To avoid drawing unwarranted conclusions for any particular enterprise, the reader must closely examine the assumptions used. If they are not appropriate for the situation at hand, you should adjust the costs and/or returns.

2001 COST OF PRODUCING PROCESSING AND FRESH POTATOES UNDER CENTER PIVOT IRRIGATION, COLUMBIA BASIN, WASHINGTON

Herbert Hinman, Gary Pelter and Erik Sorensen¹

INTRODUCTION

The enterprise budgets presented in this publication are based on potatoes produced in the Bureau of Reclamation's Columbia Basin Project. The project area is in the "big bend" of the Columbia River in south central Washington. Rainfall ranges from 6-10 inches annually; thus, crops depend on irrigation water pumped from behind the Grand Coulee Dam. Irrigation water availability, coupled with a growing season of 140 to 200 days, makes it possible to grow a multitude of crops.

In the year 2000, Washington State produced 108.0 million cwt. of potatoes on 180,000 acres. This was the largest yearly production of potatoes ever within Washington, an increase of 13 percent from the 1999 production of 95.2 million cwt.² Of the potatoes sold in Washington, in the year 2000, approximately 12% were sold on the fresh market with the remaining 88% being sold on the processing market.³

The general objective of this study was to develop enterprise budgets for both fresh and processing fall potatoes. The specific objectives were:

- 1. Identify production practices representative of well-managed potato enterprises grown under center pivot irrigation in the Columbia Basin.
- 2. Provide estimates of capital requirements, production costs, and break-even prices.
- 3. Provide current and prospective producers with a procedure for analyzing the profitability of producing potatoes.

SOURCES OF INFORMATION

The primary information for this study was obtained from a group of Columbia Basin potato producers. These producers were considered representative of well-managed farms. Their production practices and requirements for labor, equipment, and supplies are the basis for the assumptions used in this study and represent what this group of producers consider to be the latest developments. Local farm suppliers provided price information on materials and other services commonly used by farmers. Machinery costs were based on current purchase prices and rates of annual use considered typical by the producer committee.

¹Extension Economist, Grant-Adams Area Extension Agent and Benton-Franklin Area Extension Agent, respectively, Cooperative Extension, Washington State University.

³State of Washington Potato Committee, "Potato Disposition Report," March 31, 2001.

BUDGET ASSUMPTIONS

The following assumptions were made in developing the potato enterprise data:

- 1. The enterprise budgets reported are for potatoes grown under one or more 125-acre center pivot irrigation systems.
- 2. All land is assumed to be rented at \$450 per acre.
- 3. The landowner furnishes the center pivot system and the operator pays the irrigation charge amounting to \$38 per acre. For processing potatoes, annual irrigation repairs are estimated at \$12 per acre and irrigation power charges are estimated at \$50 per acre (28 acre inches). For fresh potatoes, annual irrigation repairs are estimated at \$10 per acre and irrigation power charges are estimated to be \$50 per acre (22.5 acre inches). These power costs are representative of those farmers in Grant County, Washington. Costs are generally higher in other Columbia Basin counties.
- 4. Estimated annual yield per acre is estimated at 29.5 tons for processing potatoes and 27 tons for fresh potatoes.
- 5. The interest rate is 9.5%.
- 6. There are no storage costs included in these budgets.

DISCUSSION OF BUDGET INFORMATION

The budget information for each crop is reported in a set of eight tables. Tables 1 through 5 that are followed by a "P" are budget tables for "processed" potatoes. Tables 1 through 5 followed by an "F" are budget tables for "fresh" marketed potatoes. Tables 6, 7, and 8 refer to both processing and fresh potatoes. A summary of the information in each table follows.

Tables 1P and 1F. Schedule of Operations and Costs Per Acre

Tables 1P and 1F outline the schedule of field operations by month, the type of machinery and labor use, the hours of machine use per acre, and total production costs for processed and fresh potatoes, respectively.

Production costs are divided into two categories: (1) fixed costs, which include machinery ownership, land costs, and management, and (2) variable costs, which are associated with operating machinery, hiring labor, and purchasing services and materials. Total cost is the sum of fixed and variable costs.

Machinery fixed costs include depreciation, interest on the investment, property taxes, insurance, and housing costs. These costs are incurred whether or not a crop is grown and do not vary with the size of the enterprise, given the ownership of a specific machinery complement. Machinery fixed costs for a specific field operation are determined by multiplying the machine hours per acre times the per-hour fixed cost. The per-hour fixed costs, shown in Table 7, are determined by dividing the total annual fixed cost by the annual hours of machinery use over all enterprises for the representative farm.

Land fixed cost is equal to the cash rent typical of the area - \$450 per acre for land eligible to grow potatoes. Much of the land used for potato production is rented. Even if a crop is produced on owned land, the prevailing rental rate is an opportunity cost or foregone return for not renting out the land.

An opportunity cost of \$150 per acre for management is also listed in Tables 1P and 1F. This is representative of what the producer committee felt was a fair return to their management. Management is regarded as a fixed rather than a variable cost because one either uses management skills or loses them during the production year.

Variable costs depend directly on the number of crop acres and type of enterprise. These costs include labor, fuel, oil, repairs, fertilizer, chemicals, custom work, interest on operating capital, and overhead (telephone, utilities, legal, accounting, organization dues, etc.).

Tables 2P and 2F. Materials and Services Used by Operation

Tables 1P and 1F list the "Schedule of Operations and Estimated Cost per Acre...," for the production year. The "Service" and "Materials" columns of this table list dollar amounts spent on services and materials used with individual operations. Tables 2P and 2F list, by operation, the specific services and/or materials used, the quantities used, and the estimated prices to be paid during the production year analyzed in this study for processed and fresh potatoes, respectively.

<u>Tables 3P and 3F.</u> <u>Itemized Costs per Acre</u>

Tables 3P and 3F are itemized summaries of the costs presented by field operation in Tables 1P and 1F, respectively. Most items are self-explanatory. However, "Tractor Interest" and "Machinery Interest" warrant explanations. These costs represent the opportunity cost (returns foregone by investing in machinery rather than in alternative investments) or interest paid to finance this equipment. The cost is calculated on the average annual value of the machinery over its lifetime multiplied times a 9.5% interest rate:

Tables 4P and 4F. Break-Even Selling Price per Ton

Tables 4P and 4F present four selling price levels needed for different levels of cost recovery for processing and fresh potatoes, respectively.

The first break-even price is that necessary to cover total variable costs – those costs that occur only if the crop is produced. If the price is below this level, the crop is uneconomic to produce, even in the short run, because the added costs of production are greater than the added returns.

The second break-even price is that price necessary to cover total cash costs, including land rent. If the land is owned, its rental value would not be listed as a cash cost, but as an opportunity cost as discussed below. This price may be viewed as that price necessary to survive in the short run.

The third break-even price is the price required to cover total cash cost plus depreciation on machinery. This price allows the producer to stay in business over the long run. However, when farmers fail to include the opportunity costs associated with the investment in land and machinery when calculating their total cost break-even price, they are overstating the profitability of farming relative to alternative uses of their own resources.

The fourth break-even price is the price the owner-operator must receive to cover all out-of-pocket expenses, plus realize a fair return to labor, operating capital, and equity capital invested in land and machinery. At prices below this level the owner-operator will not earn a return on labor and capital contributions equivalent to that assumed for this study. Realization of a price above this break-even level means that in addition to covering all cash and opportunity costs, the operator will get a return to the risk taken in producing the crop.

<u>Table 5P and 5F.</u> <u>Break-Even Selling Price per Ton of Potatoes Produced at Different Yield</u> Levels.

Tables 5P and 5F are summaries of prices producers would need to receive at different yield levels if they were to break even by covering all cash and opportunity costs.

Table 6. Machinery Complement

Table 6 identifies the machinery complement used to derive machinery costs. It includes the type of machines used on the representative farm, their current replacement value (new or used), years of use before trade-in, salvage value at trade-in, annual repair cost and annual hours of use.

<u>Table 7. Hourly Machinery Costs</u>

The data in Table 6 are used to estimate per-hour fixed and variable costs appearing in Table 7. Machinery fixed costs include depreciation and interest on investment, property taxes, and insurance – costs that do not vary with the crop grown or the number of acres produced. Current replacement costs are used for all machinery and equipment. While this assumption may result in an overstatement of production costs, it is an indication of the enterprise's ability to generate the earnings needed to replace depreciable assets. Continuing increases in prices paid for machinery

and equipment mean that depreciation claimed on assets purchased before price advances understates the amount of capital currently required to replace assets. When an enterprise is evaluated to determine its long-run viability, it is important to consider its ability to replace depreciable assets. Note that interest on investment represents an 9.5% opportunity cost to the enterprise. These are earnings foregone by investing money in the machinery complement rather than the next best alternative. This may also represent the interest paid on funds borrowed to finance machinery purchases.

Machinery variable costs include machine repair, fuel, and lubrication – costs that vary with the crop grown or the number of acres of crop produced.

Table 8. Input Prices

Prices used for fuel, fertilizer, chemicals, seed, custom services, labor and other inputs are listed in Table 8.

Table 8. Input Prices. (continued)

Item	Unit	Price
Hauling:		\$
Potato Seed	Ton	7.00
		7.00
Potatoes	Ton	7.00
Irrigation		
Irrigation Water	Acre	38.00
Irrigation Repair(Processing Potatoes)	Acre	12.00
Irrigation Power (28 ac. in.)		50.00
Irrigation Repair(Fresh Potatoes)		10.00
Irrigation Power (22.5 ac. in.)		40.00
Rental of Fertigation Equipment		1.00
Misc. Inputs		
Land Rent	Acre	450.00
Potato Seed ¹	Cwt.	13.00
Nema & Soil Test	Acre	1.00
Nema Test	Acre	0.55
Consultant ²	Acre	22.40
Operator Labor	Hour	12.00
Hand Labor	Hour	10.00

 $^{^{1}\}mathrm{Seed}$ includes fungicide treatment and cutting. $^{2}\mathrm{Consultant}$ includes pest, nutrient and soil moisture monitoring, and petiole analysis.

Use pesticides with care. Apply them only to plants, animals, or sites listed on the label. When mixing and applying pesticides, follow all label precautions to protect yourself and others around you. It is violation of law to disregard label directions. If pesticides are spilled on skin or clothing, remove clothing and wash skin thoroughly. Store pesticides in their original containers and keep them out of the reach of children, pets, and livestock.
